1.1 About ADSL

Asymmetric Digital Subscriber Line (ADSL) technology provides high-speed data access across regular phone lines (copper wires) by making use of previously unused frequency bandwidth above the voice band. By placing the ADSL signal above the frequency of the voice signal, ADSL service is able to coexist on the same line with your telephone service. ADSL is asymmetric in the sense that it provides a higher data rate in the downstream (receive) direction than in the upstream (transmit) direction. Asymmetric operation is ideal for typical home and small office use where files and information are downloaded more frequently than uploaded.

corega DSLAAU is capable of supporting the following DSL standards: ANSIT1.413 Issue 2, ITU G.992.1 (G.DMT), ITU G.992.2 (G.lite), and ITU G.992 Annexes A, B, and C as applicable.

1.2 Protocol and Device Driver Selection

corega DSLAAU can be easily connected to a USB port on the PC via a standard USB cable. corega DSLAAU is fully software upgradeable so that new features and updates may be added by simply loading a new version of the device driver onto your PC.

two types of device drivers are provided for corega DSLAAU, WAN, and LAN. The proper choice of driver depends on the combination of Windows operating system and protocol.

 WAN driver – This driver causes the modem to resemble a dialup modem. Call establishment is performed through Dial-Up Networking. This driver supports RFC 2364 and 2516 with PVC connections. It can be used with Windows 98, Windows 98 SE, Windows 2000, Windows Me, and Windows XP, MAC OS 9.x (RFC 2364 only), MAC OS X 10.1.x and above (RFC 2364 only), as well as Linux.

2. LAN driver - This driver makes the modem appear as a LAN or Ethernet device. Connection establishment is automatic. This driver supports RFC 1483 with PVC connections. Additionally, PPPoE is supported via third-party software. This driver can be used with Windows 98, Windows 98 SE, Windows 2000, Windows Me, and Windows XP, MAC OS 9.x, MAC OS X 10.1.x and above, as well as Linux.

Driver Type	Protocol	Operating System
WAN	RFC 2364 RFC 2516 (not with MAC OS 9.x, nor with MAC OS X)	Windows 2000 Windows XP Windows 98 SE Windows 98 MAC OS 9.x MAC OS X 10.1.x and above
LAN	RFC 1483 RFC 2516 (MAC OS X 10.1.x and above, only)	Windows 2000 Windows XP Windows 98 SE Windows 98 MAC OS 9.x MAC OS X 10.1.x and above

Point-to-Point Protocal over Ethernet

PPPoE (Point-to-Point Protocol over Ethernet) is a specification for connecting multiple computer users on an Ethernet to a remote site through common customer premises equipment. PPPoE can be used to have an office or building-full of users share a common DSL (Digital Subscriber Line) connection to the Internet. PPPoE combines the Point-to-Point Protocol commonly used in dialup connections, with the Ethernet protocol, which supports multiple users in a local area network. The PPP Protocol information is encapsulated within an Ethernet frame.

corega DSLAAU supports PPPoE for WAN and LAN applications, as presented in this section.

· PPPoE for WAN Applications

PPPoE support is embedded into the WAN driver making the modem appear as a dial-up modem to the operating system. Dial-Up Networking is used to establish a connection. Follow the installation instructions provided in this manual when

implementing PPPoE with the WAN driver.

· PPPoE for LAN Applications

PPPoE is supported via third party software when implemented with a LAN driver, making the modem appear as a local area network (LAN) device to the operating system. It allows multiple computer users on an Ethernet to share a common DSL connection to the Internet.

After installing the LAN driver, follow the installation instructions

provided with the third party PPPoE software. The third party software will search for existing drivers. If multiple drivers are installed, select corega DSLAAU as the adapter of choice.

Internet connection will be made through the third party software. You will be required to enter your User Name and Password.

Specifications

corega DSLAAU Connector

corega DSLAAU is connected to your PC via a USB cable. The rectangular end of the USB cable inserts into the USB port of your PC while the square end of the cable inserts into the USB port of corega DS-LAAU.
